

It is recommended to checks the configuration file for syntax and other errors :

If all looks good, you should get something similar to the following:

Then restart the server to apply the changes:

Apply the configuration, restart Unbound service and verify its status.

Then, confirm that the exception is working as expected by running the previous dig queries for dnssec-failed.org zone and verify that you received the resource records instead of SERVFAIL.

Once you have confirmed this, you can now remove the exception from your configuration.

!

## Conclusion
